Commands

2

Commands

- Git init : Initializes the local repository to start tracking the project
- Git status: Checks the state of the file and identifies untracked changes
- Git add: Moves specific files to the staging area before a commit.
- Git commit - m " " : Saves the changes permanently in the projects history.
- Git checkout -b : Create a new feature branch and switches to it.
- Git checkout : Change back to an existing branch.
- Git merge: Makes the changes from one branch to another.
- Git remote add origin: Connects the project with GitHub repository URL.
- Git push -u origin main: Uploads the code and history to the cloud for the first time.
- Git push origin main: Updates the remote repository with the latest commits.
- ni <name>: Add archive, in my case README.md .
